

SUMMARY

Integration for Allscripts Homecare reduces barriers to patient information by allowing homecare clinicians to interact with the most current patient records, whether online or offline. While on the road, homecare workers can access patient charts and supporting content directly from their familiar Allscripts Homecare interface. Benefiting from OnBase functionality, users can update patient files, collect electronic signatures and capture new content, including images. Once connectivity is reestablished, changes are synced back into OnBase and the updated files become immediately available throughout the organization.

BENEFITS

- **Improve the quality of patient care** by maintaining consistent access to the most current information outside of the typical healthcare setting, even while offline.
- **Maximize time devoted to patients** by eliminating the need to physically transport files between the hospital and the point of care and reducing time spent searching through paper documents.
- **Increase productivity of homecare staff** by providing a single point of capture, eliminating the need for redundant data entry.
- **Alleviate security risks and support HIPAA compliance** by eliminating paper files.

DESIGN

While connected to OnBase, patient information is placed on a tablet or laptop and taken offline. During patient visits, homecare staff can create E-Forms, collect signatures, add notes and annotations to patient charts, modify documents and more, benefiting from OnBase functionality while remaining in their Allscripts Homecare interface. Upon reestablishing a network connection, changes are synchronized and updated patient information becomes available enterprise-wide.

APPLICATIONS

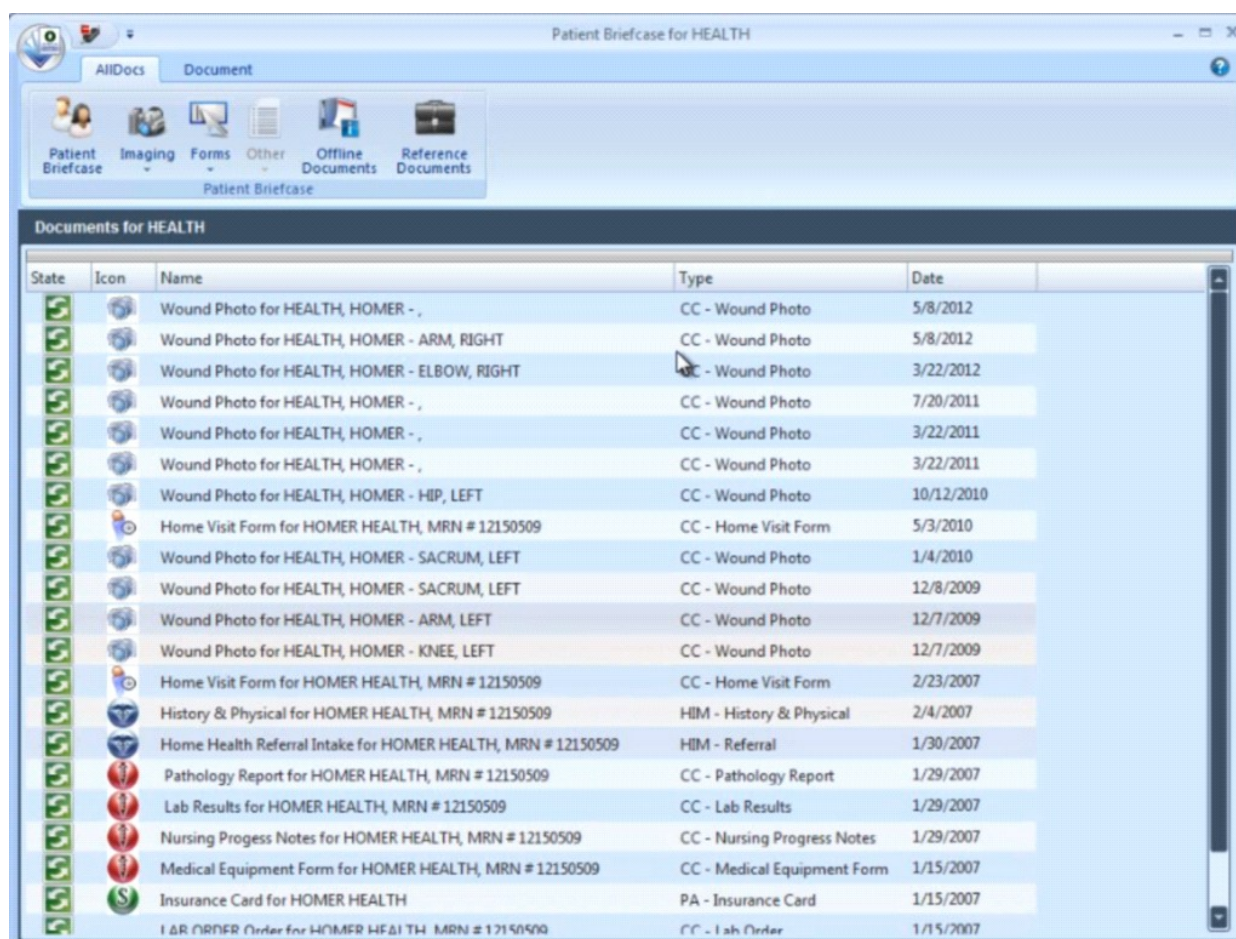

Post-Operative Home Healthcare — Following surgery, clinicians may need to follow-up with patients at home to perform post-op care. Integration for Allscripts Homecare makes it easy for homecare staff to stay informed with electronic access to the most current H&Ps, lab results and other patient information, even while offline. Staff can contribute wound photos and other images, such as insurance cards and patient IDs, directly from the point of care.

Hospice — While trying to provide the best possible care and support for patients and their families through the grief and bereavement process, homecare workers are burdened with the responsibility of administrative tasks. Integration for Allscripts Homecare enables staff to access the most up-to-date content relevant to each patient's case, regardless of a network connection. This alleviates the burdens associated with administration and allows staff to focus on providing personalized, quality patient care.

KEY FEATURES

- **Patient information is always available directly from Allscripts**, both online and offline.
- **Imaging functionality** allows onsite photos to be instantly captured and uploaded.
- **Offline creation and modification of patient documents**, including forms, enables data capture at the point of origination.
- **Electronic signature capability** accelerates business processes and provides a complete record of the patient visit.
- **Local data encryption** reduces the risk of exposing confidential information if a device is compromised.
- **Tabbed view** mirrors chart layout for intuitive content organization.

INTERFACE

The screenshot shows the 'Patient Briefcase for HEALTH' window. It features a top navigation bar with 'AllDocs' and 'Document' tabs. Below this is a 'Patient Briefcase' section with icons for Patient Briefcase, Imaging, Forms, Other, Offline Documents, and Reference Documents. The main area is titled 'Documents for HEALTH' and contains a table listing various documents.
